

Full-model agreement with the stock build

8x H100 SXM5, TP8. Both builds served the same checkpoint on the same machine with the same seed. The lower two bars are controls: each build compared against itself at a different batch size. They set the floor that any cross-build number has to be read against.

32 of 32 prompts produced identical greedy tokens. 2369 tokens compared, on the real 975B NVFP4 checkpoint at TP8. Neither control reproduced its own tokens across batch sizes, so the platform itself is not batch-deterministic at this scale.
